- Visible red light, large light spot for exact, reliable edge detection – positioning on glossy, broken (perforated) metallic surfaces e. g. slide bolts
- Optimized light spot for detecting containers which are not completely closed (perforated boxes)
- An additional status display on the front side of the sensor makes possible place-saving alignment, optimum scanning range adjustment and rapid function control
- Ultra-simple integration into the existing control environment – large selection of switching outputs, activation input
- Minimal current consumption – reduction of energy consumption in standby operation
- A²LS – Active Ambient Light Suppression

Accessories:

(available separately)

- Mounting systems (BT 25, UMS 25...)

Application notes

- For glossy surfaces (e.g. metals), the light beam should not be incident on the object surface at a right angle. A slight inclination is sufficient for preventing undesired direct reflections. This may result in a reduction in the scanning range.
- Objects should only be moved in laterally from the right or left. Moving in objects from the connector side or operating side is to be avoided.
- Outside of the scanning range, the sensor operates as an energetic diffuse reflection light scanner. Light objects can still be reliably detected up to the scanning range limit.
- The sensors are equipped with effective measures for the maximum avoidance of mutual interference should they be mounted opposite one another. Opposite mounting of multiple sensors of the same type should, however, absolutely be avoided.
